Exercise 6

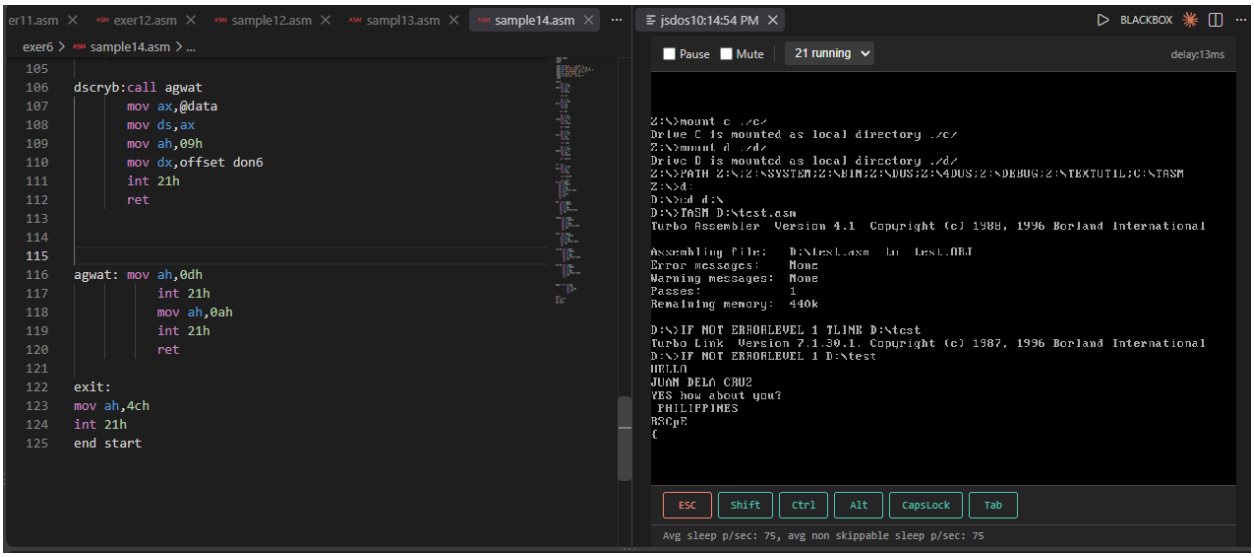

Example No. 1: The program will print the key pressed using Function 01h and it will stop after the 10th character input has been pressed. Save the program using sample12.asm as the filename

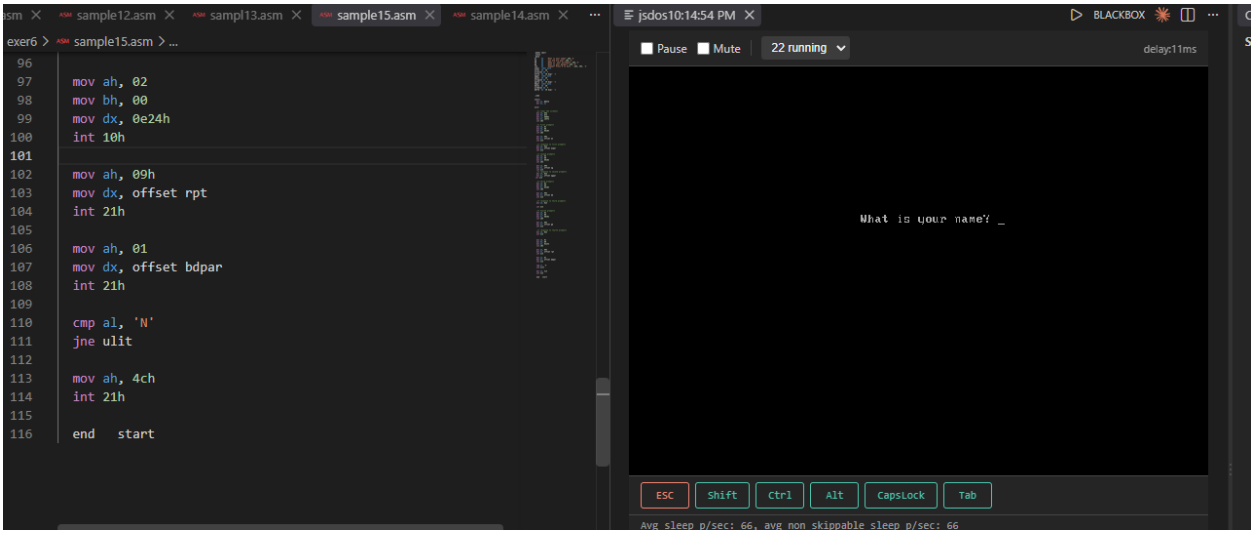

Example No. 2: This program will prompt the user to press uppercase or lowercase letter from the keyboard and responds with a message of what letter has been pressed by the user. The program uses the function 07h to facilitate input without echo. Save the program using sample13.asm as the filename

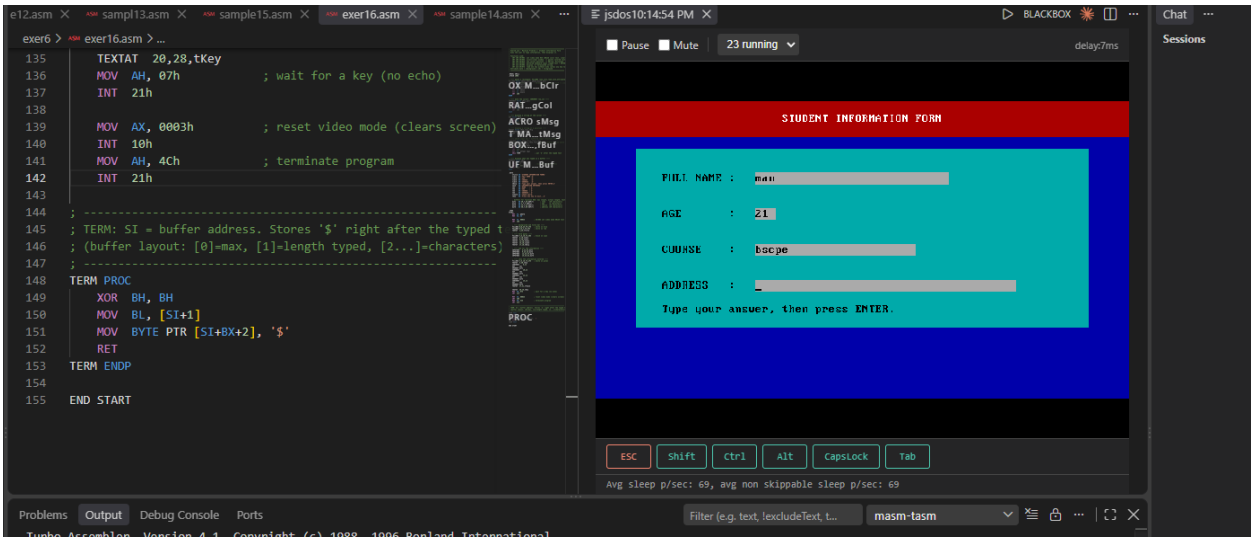

Example No. 3: Simple BOT chat. This program will respond based on what has been pressed from the keyboard using Function 01h, Function 07h, Counter register, and conditional/unconditional instruction. Save the program using sample14.asm as the filename

Example No. 4. This program prompts the user to input the required information. To facilitate clean output, functions 06h will be used to clear the screen, 02h to set the screen location to display the prompts, 09h to display, and 0Ah to request input from the user. Save the program using sample15.asm as the filename

Machine Problem 1. Write a program that will create an output similar below and asks the user to input the necessary information. Use the functions 06h, 02h, 0h, 0Ah, and 07h or 01h. Save the program using Exer16.asm as the filename.

Machine Problem 2. Write a program that will paly the Paper, Rocks, Scissors game. To make sure that each player will not see his opponent's inputted letter, use function 07h to accept the single character input (P, R, or S) of the player. (For the purpose of monitoring the correctness of input character, function 01h maybe used during the program development and testing. Just make sure that the final program will use function 07h instead of 01h). Make the program more flexible by allowing the players to enter either lowercase or uppercase letters. The program must repeat its execution until the players decided to terminate. Use as many functions and designs that have already been discussed before. The sample basic output below maybe used as a guide. Save the program using Exer17.asm as the filename.
